

Argentina expects a record harvest of cherries

Cherry producers estimated that the harvest this season will produce up to 5,000 exportable tons, with an extended growth in the northern region of Patagonia.

The executive manager of the Argentine Chamber of Integrated Cherry Growers (CAPCI), Anibal Caminiti, said that "Argentina's current cherry season has the prospect of achieving a record production."

According to Caminiti, Argentina will achieve a record production "provided that the environmental conditions continue to be good until February, when the southernmost cherry harvest season in the country ends."

He also said that they expected an "increase in the participation of all the producing regions."
