

Russia's annual greenhouse tomato production reached 380 thousand tons

In the 2017-2018 campaign, Russia's average production of greenhouse tomatoes amounted to 380 thousand tons. The statistics have been provided by researchers of the marketing agency ROIF Expert in the report "Greenhouse Tomatoes in Russia: Maximizing Production".

It is worth noting that the share of greenhouse tomatoes in the market has reached 45%. The main market trend has been the sharp growth in the share of tomatoes against the background of a reduction in the share of cucumbers. The gross tomato harvest in 2017-2018 grew by almost 25%, while the production of greenhouse cucumbers by only 0.2%.

According to a ROIF Expert, the most negative aspects affecting the development of greenhouse tomato production in Russia until 2023 will be the depreciation of fixed assets, the high capital costs for the construction of new greenhouse complexes, the increased competition between Russian and foreign suppliers in the vegetable market, or the pressure from federal retailers. Many will also be affected by infrastructure or logistics problems.
